Table 2. Leaf breakdown rates (d^{-1}) of alder leaves in coarse-mesh (k_c) and fine-mesh (k_f) bags at six sampling sites in the Ave River.

W_{oc} and W_{of} , initial leaf mass in coarse-mesh and fine-mesh bags, respectively; r^2 , coefficient of determination; SE, standard error.

In each column, similar superscript letters indicate no significant differences ($p < 0.05$) between leaf breakdown rates (Tukey's multiple comparison).

Table 3. Assessing functional condition in the Ave River using ratios of leaf breakdown rates in coarse-mesh (k_C) and fine-mesh (k_f) bags, according to the criterion and significance defined by Gessner and Chauvet (2002). Score 2 ($k_C:k_f = 1.2-1.5$), score 1 ($k_C:k_f = 1.5-2.0$ or < 1.2) and score 0 ($k_C:k_f > 2.0$). Values of k_C and k_f are in Table 2.

Sites	$k_C:k_f$	Score	Significance
L1	1.4	2	No clear evidence of impacted river functioning
L2	1.8	1	Compromised river functioning
L3	2.5	0	Severely compromised river functioning
L4	1.8	1	Compromised river functioning
L5	1.9	1	Compromised river functioning
L7	1.9	1	Compromised river functioning
