Preface

This book compiles the papers presented at the 4th International Conference on Energy & Environment: bringing together Engineering and Economics (ICEE2019) that took place in Guimarães, Portugal in May 16-17, 2019

The conference was organized by the School of Engineering, University of Minho and the School of Economics and Management, University of Porto.

ICEE2019 brought together leading academic scientists, researchers and scholars from the energy and environment science community to interchange knowledge, to discuss and to disseminate new ideas towards a low-carbon, sustainable future.

Indeed, energy and environment transition issues require much more than pure technology knowledge. Instead, they involve processes of technological transfer where economics, social sciences, and even politics play decisive roles. Recognizing this quest for interdisciplinarity, papers covered the following issues: Energy Economics; Renewable Energies; Sustainable Mobility Solutions; Sustainability in Energy and Buildings; Environmental and Social Impact Assessment; Energy Modelling; Sustainable Development; Energy Storage; Environmental Management and Technological Change; Energy and Environmental Policy; Energy Markets and Efficiency; Climate Change; Biomass/Biofuels; Economic Growth and Sustainability; Energy Systems Analysis and Waste Management.

The Editors would like to thank all the authors and reviewers for their valuable contribution and for making ICEE2019 such a big success.

Paula Ferreira
Chair of the 4th ICEE

Table of Contents

Chapter I

ENERGY ECONOMICS

The double dividend of a new environmental tax reform with promotion of resource substitution Susana Silva, Isabel Soares and Óscar Afonso	15
Measurement of the rebound effect on residential electricity consumption in the European Union Countries António Cardoso Marques and Ana Castro Mendes	21
A LMDI Decomposition and Decoupling effort analysis of the driving forces behind CO2 emissions per capita from individuals and set in Central América Victor Moutinho, António Marques and Vera Magalhães	26
Is RES powered desalination a viable solution for water stressed regions? A case study in Algarve, Portugal Gil Azinheira, Raquel Segurado and Mário Costa	31
Energy intensity indicator as a tool to improve the design of energy policy: Some exploratory results Jorge Cunha, Manuel Nunes, Fátima Lima and Wei Cai	37
The accounting-and-finance of a solar photovoltaic plant: economic efficiency of a replacement project Carlo Alberto Magni and Andrea Marchioni	44
Equilibrium modelling for partial combustion of forest biomass Marcela Magalhães Marcelino, Gaudêncio Freires, Carine Tondo Alves, Sílvio A. B. Vieira de Melo and Ednildo Andrade Torres	51
Fuel price control in Brazil: environmental impacts Thereza Aquino, Roberto Ivo and Adriano Nogueira	57
Development of a costing methodology for solar thermal systems: application to Portuguese scenario Ana C. Ferreira and Ângela Silva	64
Investments in wind energy: an analysis of the relation between regulatory governance and project finance Nelson Siffert Filho, Thereza C. N. de Aquino, Maria da G. D. Fonseca and Ana L. S. Mendes	71

Chapter II

RENEWABLE ENERGIES

Photovoltaic self-consumption and behaviour changes in electricity consumption António Cardoso Marques, Daniela Ferraz	78
Economic analysis of energy efficiency measures for the Brazilian power system Géremi Gilson Dranka, Paula Ferreira	85
Determinants of the energy transition: empirical evidence for OECD countries Tiago Lopes Afonso, António Cardoso Marques and José Alberto Fuinhas	92
Green energy support policies and renewable energy cooperatives in Europe Nikola Šahović and Patricia Pereira da Silva	98
System dynamics approach for evaluating shale gas exploitation Andréa Gomes, Paula Ferreira, Amarildo Cruz, Estevão Freire, and Luiz Borges	106
Lower peak demand and electricity bill using uninterruptible power supply and solar electricity Fabien Chidanand Robert and Sundararaman Gopalan	114
Tax and financial incentives for the development of renewable energy in the Brazilian electric matrix Priscila Elise Alves Vasconcelos and Paulo Sérgio Vasconcelos	121
Scoring method of eco-efficiency using DEA approach: evidence from European waste sectors Vera Magalhães, Victor Moutinho, António Marques and José Alberto Fuinhas	128

Chapter III

SUSTAINABLE MOBILITY SOLUTIONS

An analytical framework to assess the contribution of new technologies to Societal Challenges Paula Ferreira, Ana Rocha, João L. Afonso, Vitor Monteiro, Gabriel Pinto and Madalena Araújo	136
Rethinking the use of soft modes - Bicycles: towards ensuring sustainable mobility and social innovation António Amaral, Luis Barreto, Sara Baltazar and Carla Rocha	145
Comparative assessment of electricity procurement alternatives: the case of Oporto's light rail Paulo Gouveia, Joana Resende and Pedro Campos	151
Development of an over-expanded engine to be used as an efficiency-oriented range extender for Electric Vehicles Jorge Martins, Francisco Lopes, Carlos Castro, António Moreira and F. P. Brito	159
Economic and risk factors of a transshipment system using electric cargo bikes for urban courier services Paulo A. D. Ormond Jr, Paula Varandas Ferreira, Paulo Sérgio Afonso and José Telhada	167
Comparative sustainable lifecycle analysis of bus rapid transit (BRT) and metro: a case study of Rio de Janeiro city Ana Carolina Angelo, Isabelle Martins, Lino G. Marujo, Leonardo Mangia and Marcelle Cordeiro	174
Vehicle-to-Anything: a power transfer perspective for vehicle electrification Vitor Monteiro, Tiago J. C. Sousa, Paula Ferreira, Júlio S. Martins, João L. Afonso	179
Human- inductively powered lightweight Electric Vehicles: sustainable transportation for the Smart City L. A. Lisboa Cardoso, A. A. Nogueiras Meléndez, Luis A. S. B. Martins, and João. L. Afonso	185
Innovative communication system for Railway Smart Metering towards efficiency improvement Vitor A. Morais, João L. Afonso and António P. Martins	191
EducaBicla Program - a Guimarães case study Luis Barreto, António Amaral, Sara Baltazar and Carla Rocha	197

Chapter IV SUSTAINABILITY IN ENERGY AND BUILDINGS

Key interlinks between housing energy expenditures and sociodemographic features Fátima Lima, Paula Ferreira and Vítor Leal	204
Membrane for rooftop extensions: an economical and environmentally efficient alternative Monica Macieira, Paulo Mendonça and João Miranda Guedes	213
A decision support tool to rank energy efficiency options in services buildings João Pedro Gouveia, Sofia G. Simoes, Marko Cavar, Adam Babić, Monica Salvia, Carmelina Cosmi, Norberto Fueyo, María Herrando and Antonio Gómez	220
Regional impact assessment of retrofit and energy efficiency measures on residential building stock energy consumption Pedro Palma and João Pedro Gouveia	226
Machine learning methods for buildings energy consumption within enterprise information systems Francisco Pires Costa, Elsa Fontinha, Carlos Augusto S. Silva and Benjamim Domingos	236

Chapter V ENVIRONMENTAL AND SOCIAL IMPACT ASSESSMENT

Choice experiments to elicit the users' preferences for coastal erosion management - The case of Praia da Amorosa Susana Oliveira, Lígia M. Costa Pinto and Ana Costa	243
Assessment of the energy cooperative service: the case of electricity distribution cooperatives in Brazil Claudio Ruy Portela de Vasconcelos, Paula Ferreira and Jorge Cunha	249
Biophysical and monetary quantification of avoided water erosion in an area at the North of Portugal Élia Pires-Marques, Cristina Chaves, and Lígia M. Costa Pinto	257
Fog harvesting meshes physical, economic and environmental characterization Lujain Hadba, Paulo Mendonça, Lígia Torres Silva and Miguel Carvalho	263
Assessing Electric Vehicle CO₂ emissions in the Portuguese power system using a marginal generation approach Ezequiel Carvalho, Jorge Sousa and João Lagarto	269
Material concepts grounding the dimensions of business sustainability - the case of European electric utilities Marta Guerra-Mota	276
Examining consumer perceptions of organic and genetically modified food José Pedro Barros, Cristina Chaves and Marieta Valente	283
How do fishermen and indigenes conserve the source of their livelihood? An analysis based on the public good game applied in a hydroelectric power plant Fabrício Baron Mussi, Ubirata Tortato and Aline Alvares Melo	288
A novel sustainability assessment framework for manufacturing companies Mahdi Naderi, Gustavo Pelaez, Paula Ferreira, Enrique Ares and Antonio Fernandez	293
Exploring consumer acceptance of a vegetarian diet amongst vegetarians and non-vegetarians Marieta Valente, Cristina Chaves and Cármen Fontes	301

Chapter VI ENERGY MODELLING

Sustainability optimisation of shell and tube heat exchanger using different optimisation techniques Juan José Cartelle Barros, Manue Lara Coira, María Pilar de la Cruz López, Alfredo del Caño Gochi and Isabel Soares	307
The neural modelling of energetic value of different silages used as substrate in biogas plants Alina Kowalczyk-Juško, Patrycja Pochwatka, Maciej Zaborowicz, Jakub Mazurkiewicz, Krzysztof Józwiakowski, Andrzej Mazur, Jacek Dach	316
Modelling and forecasting residential energy demand using household-level survey data in developing countries: the case of Angola Francisco Pires Costa, Elsa Fontinha, Carlos Augusto S. Silva and Benjamim Domingos	323
Modelling integrated water resource allocation for agriculture and economical energy production in the Laja Lake Basin considering new irrigation policies M. Matus, R. Sepúlveda, E. Sierra, C. Matamala and C. Benavides	327
A long-term analysis of the energy security performance of ten South American countries Jaqueline Vieira, Patrícia Pereira da Silva and Pedro André Cerqueira	333
A model proposed for monitoring and licensing of energy facilities in Mato Grosso do Sul, Brazil Paulo Sérgio Vasconcelos and Flávio Pereira Guimarães	339
Disaggregation of heating, cooling and small appliances loads for very low sampling data rate Monica M. Eskander and Carlos A. Silva	345
Environmental and energy quality: sobane methodology adapted to canteens Yasmin Bellizzi, Luís Frólén Ribeiro, Jorge Lopes and Arthur Medeiros	351
Compact automotive thermoelectric generator with embedded heat pipes for thermal control I. Pacheco, F.P. Brito, R. Vieira, J. Martins, L.M.	357
Cost estimation of rail power conditioner topologies based on indirect modular multilevel converter in V/V and SCOTT power transformers Mohamed Tanta, Gabriel Pinto, Vítor Monteiro, António P. Martins, Adriano S. Carvalho and João L. Afonso	365

Chapter VII SUSTAINABLE DEVELOPMENT

The competitiveness of the Portuguese wine sector: an important indicator for a sustainable development Vitor João Pereira Domingues Martinho	372
---	-----

Adaptive management: thinking over a way to reduce environmental problems from livestock production Carlos Correia and Cristina Chaves	378
Development of sustainable business model for choosing services to the customers in Internet Service Provider companies Sara Sadat Golmaryami, Manuel Lopes Nunes and Mehdi Fathollah	385
The role of organizational commitment in the emergence of sustainable behaviour on the part of the organizations employees Aline Alvares Melo; Ubiratã Tortato and Fabricio Baron Mussi	394
A critical analysis of sustainability reporting by mining companies Wellington Alves, Paula Ferreira, Madalena Araújo and Pineiro-Chousa	400
The behaviour of external markets for the Portuguese wine: its implications in the sustainability of the sector Vitor João Pereira Domingues Martinho	406
Unfolding the complexity of the nexus between land, energy, and emissions in the energy transition: the case of Mexico Rafael Gonzalez-Lopez and Mario Giampietro	412
Electricity consumption profiles of multiple activities at city level João Pedro Gouveia, Lisandra Miguel and Júlia Seixas	419
A European Union efficient allocation of renewable energy sources Fernando deLlano-Paz, Paulino Martínez Fernández and Isabel Soares	425
Modelling the management of water supply networks in Awka and Amaibia, Nigeria for sustainable development Okechukwu Odumodu	443

Chapter VIII ENERGY STORAGE

Regulatory framework benchmark for energy storage: the case of compressed air energy storage Catarina R. Matos, Patricia P. Silva and Júlio F. Carneiro	451
Innovative energy storage systems as a tool to improve the quality of electricity within the Intelligent Development Operation Programme Wojciech Drozd	462
Study on the technological and economic viability of introducing energy storage systems with solar photovoltaic panels Luis A. M. Barros, João L. Afonso, P. Ferreira, M. Araújo and J. G. Pinto	469
GHG emission reduction for ground-source heat pumps: energy storage using phase-change materials Emanuele Bonamente and Andrea Aquino	476
Unified Power Converters for battery charging and traction drive systems for Electric Vehicles: cost and performance analysis Tiago J. C. Sousa, Vitor Monteiro, M. J. Sepúlveda, Júlio S. Martins and João L. Afonso	482

Chapter IX ENVIRONMENTAL MANAGEMENT AND TECHNOLOGICAL CHANGE

Turnover growth and eco-innovation: a European overview Mara Madaleno, Mónica Meireles, Marta Ferreira Dias and Margarita Robaina	489
Cogeneration systems using internal combustion engines and absorption chillers Marcos Scaramussa Jr, Felipe Barroco, José Alexandre, Julio Silva, Ednildo Torres and Marcelo Silva	495
Innovation networks: R & D interactions in Brazil's energy sector Isabel Cristina dos Santos, Antonio Henriques de Araújo Júnior, Humberto Medrado Gomes Ferreira and Caroline Campos Neves	501
A better characterization of biophysical performance using the transformation matrix: the case of the paper and pulp industry from a nexus perspective Raúl Velasco-Fernández, Mario Giampietro and Laura Pérez-Sánchez	507
The effect of urban air pollutants in Germany: Fractional regression models for second step DEA and SFA applied in Eco-efficiency analyses Victor Moutinho, Mara Madaleno and Pedro Macedo	514

Chapter X ENERGY AND ENVIRONMENTAL POLICY

Energy planning policy for the reduction of poverty in Brazil: the case of the condominiums Praia do Rodeadouro and Morada do Salitre Felipe Cunha, Maria Candida Mousinho, Luciana Carvalho, Fábio Fernandes, Marcos Scaramussa Jr. Ednildo Torres, Marcelo Silva and Celso Castro	521
Study of the economic viability of cogeneration systems in Portugal: the impact of legislation on the investment decision Ana C. Ferreira, Senhorinha F. Teixeira, José C. Teixeira, Manuel L. Nunes and Silvia A. Febra	527
An evaluation of the energy and environmental policy efficiency of the EU members states in the last 20 years from MPT perspective Paulino Martínez Fernández, Fernando deLlano-Paz, Anxo Calvo-Silvosa and Isabel Soares	534
European assessment of support for eco-innovation: impacts over firm performance Margarita Robaina, Marta Ferreira Dias, Mónica Meireles and Mara Madaleno	542
What influence do renewable energy policies have on household electricity prices? Application to the EU-28 María Teresa García-Álvarez, Laura Cabeza-García and Isabel Soares	548

Chapter XI ENERGY MARKETS AND EFFICIENCY

Exploring the factors that contribute to sustainable consumption and production in the EU-28 Gustavo Pineiro-Villaverde, María Teresa García-Álvarez and Isabel Soares	554
Psychological barriers in the electric market: study applied to the NORD pool market Carlos Almeida, Mara Madaleno and Margarita Robaina	560

Diffusion degree for diesel Gonçalo Martins, Mara Madaleno and Marta Ferreira Dias	565
Structural breaks in gasoline and diesel elasticities: a dynamic analysis of the Portuguese case Susana Silva, Isabel Soares and Carlos Pinho	571
The impact of a tailored end-user engagement framework on peer-to-peer energy sharing initiative: an empirical study Lurian Klein, Luisa Matos and Giovanni Allegretti	576
An impact analysis of renewable energy on electricity spot market prices Carlos F. Alves and Pedro D. Pinto	585
Do dynamic tariffs promote investment in renewables? The case of non-regulated monopoly João Correia-da-Silva, Isabel Soares and Raquel Fernández González	591
An econometric approach to design and assess the Demand-Side Management policies and measures: France case of study Diogo Santos Pereira and António Cardoso Marques	597
Energetic efficiency analysis of the agricultural biogas plant working as peak installation Jacek Dach, Wojciech Czekala, Alina Kowalczyk-Juško, Jakub Mazurkiewicz, Patrycja Pochwatka, Andrzej Lewicki and Damian Janczak	604

Chapter XII CLIMATE CHANGE

Introducing climate variability in energy systems modelling Filipa Amorim, Sofia G. Simões, Edi Assoumou and Gildas Siggini	610
Circular economy and climate mitigation: benefits and conflicts Patrícia Fortes, Rita Lopes, Luis Dias, Júlia Seixas, João Pedro Gouveia, Sandra Martinho, Joana Monjardino and Hugo Tente	617
The influence of climate change on the development of the Portuguese forest: creation of trend series for the occurrence of climatic anomalies Leonel Jorge Ribeiro Nunes, Catarina Isabel Rodrigues Meireles, Carlos Pinto Gomes and Nuno de Almeida Ribeiro	623
Clim2power - translating climate data into power plants operational guidance Sofia G. Simoes, Filipa Amorim, Kristina Fröhlich, Jennifer Ostermoeller, Yves-Marie Saint-Drenan, Edi Assoumou, Gildas Siggini, Valentina Sessa, Thierry Ranchin, Benoit Gschwind, Pierre Strosser, Camille Parrod, Johannes Schmidt, Hubert Holzmann, Johann Baumgartner, Ignácio Martín-Santos, Christian Mikovits, Matheu Herrnegger, Tim O'Higgins, Amy Dozyer, Katherine Kopke, Anna Krook-Riekkola, Tiago Capela Lourenço, Sílvia Carvalho, Pedro Beça, Paulo Diogo, Babar Mujtaba, Júlia Seixas, Tarik Berrada and Pedro Paes	629

Chapter XIII BIOMASS/BIOFUELS

Assessing water, energy and food nexus in an agroecological farming context: a causal loop diagram as foundation for system dynamics modelling Gabriel N. P. Albuquerque, Monique P. Dantas, Darlan A. Pereira, Mariana M. Nóbrega and Sandra Naomi Morioka	636
Biotechnology with microalgae for integration of fish farming biosystem: aquaculture biosystem: an alternative source of protein supplementation for animal feed Mária Costa, Sharline Santos, Roberto Sassi and Darlan Pereira	641
The use of forest residues in the production of thermal energy: an alternative to fossil fuels from a circular economy perspective Leonel Jorge Ribeiro Nunes, Radu Godina and João Carlos de Oliveira Matias	647
Landscape of patents on green technology of biomass torrefaction focusing on energy production José Airton de Mattos Carneiro-Junior, Douglas Alves Santos, Carine Tondo Alves, Angela Machado Rocha, Marcelo Santana Silva and Ednildo Andrade Torres	653
Biodiesel, family agriculture and competitiveness: the case of the production nucleus of Serra do Ramalho (Brazil) Fábio Matos Fernandes, Francisco Gaudêncio Mendonça Freires, Marcelo Santana Silva, Dra. Maria Cândida Arrais de Miranda Mousinho, Felipe Barroco Fontes Cunha and Luis Oscar Silva	659
Conceptual circular business model based on industrial symbiosis of a microalgae cultivation and a cement plant Ana Carolina Angelo, Fabrício Mendonça, Paulo Salomon and Lino G. Marujo	665
Energetic valorization of residual biomass: rural development model based on native forest exploitation Leonel Jorge Ribeiro Nunes and Eduardo Jorge Gonçalves Barata	671
Thermogravimetric investigation and kinetic analysis of torrefied biomass from Brazilian northeast José Airton de Mattos Carneiro-Junior, Carine Tondo Alves, Silvio Alexandre Beisl Vieira de Melo, Ednildo Andrade Torres	677
The impact of Electric Vehicles on sugar energy industry Paulo Sérgio Vasconcelos and Rosemar José Hall	683
Supply chain management of biomass for energy generation: a critical analysis of main trends Luis O. S. Martins, Roberto A. F. Carneiro, Eleni Iacovidou, Francisco G. M. Freires, Ednildo A. Torres, Marcelo S. Silva, Fábio M. Fernandes and Felipe Barroco Fontes Cunha	688
Identification and evaluation of environmental impacts in a small watershed in Northeast of Brazil Yara Iris França de Souza, Nadjacleia Vilar Almeida and Milena Dutra da Silva	694

Chapter XIV ECONOMIC GROWTH AND SUSTAINABILITY

Empirical analysis of institutional change in the Spanish photovoltaic sector: a financial approach Raquel Fernández González, Andrés Suárez García and María Dolores Garza	701
Rediscovering the EKC hypothesis for the 20 higher OECD emitters through globalization level Patrícia Hipólito Leal and António Cardoso Marques	707
The construction sector and economic growth in Sub-Saharan Africa (revisited) Jorge Lopes, Rui Oliveira and M. Isabel Abreu	713
Extracting and processing lithium: challenges in the case of Portugal Elma Pereira, Cristina Chaves and António Guerner Dias	719

Transportation energy consumption in the USA: are alternative energy sources replacing the conventional?	725
Sónia Almeida Neves and António Cardoso Marques	

Chapter XV

ENERGY SYSTEMS ANALYSIS

On the viability of DC Homes: an economic perspective from domestic electrical appliances	732
Tiago J. C. Sousa, Vitor Monteiro, José Cunha, J. C. Aparício Fernandes and João L. Afonso	
A geospatial approach towards defining electrification pathways in West Africa	738
Mounirah Bissiri, Pedro Moura, Nuno Carvalho Figueiredo and Patrícia Pereira da Silva	
Group decision model to rank investments in electric power networks	745
Flavio Trojan, Danielle Costa Morais, Antonio Vanderley Herrero Sola and Caroline Maria de Miranda Mota	
Opening the black box of energy analysis: implementing MuSIASEM with relational analysis	752
Rafael Gonzalez-Lopez and Mario Giampietro	
A novel converter topology for applications in Smart Grids: technical and economical evaluation	759
Vitor Monteiro, Tiago J. C. Sousa, Mohamed Tanta, M. J. Sepúlveda, J. C. Aparício Fernandes, and João L. Afonso	
Renewable energy survey in Algeria: policies and perspectives	765
Brahim Haddad, Paula Ferreira, Ahmed Djebli and Dalila Belhout	

Chapter XVI

WASTE MANAGEMENT

A multi-criteria approach for the selection of wastewater treatment systems	771
Andreia S. Goffi, Flavio Trojan, Paulo S.L.P. Afonso, Paula F.V. Ferreira, Mauro Lizot, Shirley S. Thesari and Juliana Biluca	
Comparative study of penetration rate of waste management practices in small and medium size companies between Europe, Portugal and Brazil	777
Lúcia Buson, Cristina Chaves and Lígia M. Costa Pinto	
Solid waste management by consideration of the pollution credit certificates theory	784
Nilo António de Souza Sampaio, Marina Jardim Faria de Araújo, Marcus Vinicius de Araújo, António Henriques de Araújo Jr, José Glenio Medeiros de Barros, Maria da Glória de Almeida and Bernardo Bastos da Fonseca	
Supply chain environmental management maturity in a pulp and paper company	794
Ivonez Xavier de Almeida, Antonio Zanin and Paulo Afonso	
Pump energy efficiency field testing and benchmarking in Brazil	800
João Pablo Santos da Silva, José Luiz da Silva Júnior and José Alberto Nicolau de Oliveira	

FOG HARVESTING MESHES PHYSICAL, ECONOMIC AND ENVIRONMENTAL CHARACTERIZATION

KEYWORDS

Fog harvesting, Energy, Environmental Impact

ABSTRACT

As fresh water becomes scarce nowadays, fog harvesting appeared as a new opportunity to be considered as an economical and a reliable fresh water source. Thus Fog collectors represent a functional solution to provide fresh water to be used in agriculture and in some cases, also as drinking water. Fog harvesting techniques had been used first by farmers as some types of adjoining cavities and containers were added around plants to take advantage of the humid weather, after that, these techniques were turned into structures. With fog harvesting techniques emerging, new materials and new structures are being developed, providing a range of options in regards to the meshes and to the harvesting methods. In this paper, Fog harvesting meshes are reviewed and analysed to process its ability on providing environmental conditioning of exterior spaces. The purpose of such tests is to acquire a new understanding and provide other options for fog harvesting materials while taking into consideration the economic and environmental aspects of each material used.

INTRODUCTION

Fog harvesting techniques are based on the physical principle that when humid air encounters a cold solid surface it results in gathering water molecules on that surface (Mull, 1997). Approximately one billion people lives with no access to clean water around the world, with the water being an important source of life in the planet, it was noticed that some plants have the ability to collect dew in foggy climate to compensate for the lack of liquid water. Taking that into consideration, the last years witnessed the development of different techniques in the purpose of harvesting water from the humid air. On Cape Verde, Oman, and Canary Island the farmers traditionally put containers under different species of trees to collect water dripping from the leaves on fogging periods. While in Palestine, the idea of a fog-collecting structure became more concrete as the inhabitants used to build structures with adjoining cavities around their vines so the surrounding fog and mist could participate in the irrigation of their plants. The idea of developing a certain structure that provides a better water collection started with Schemenauer and Cereceda as the Standard Fog Collector (SFC) was suggested (Schemenauer and Cereceda 1994), later to be involved in recent projects such as the Warka towers and recent fog harvesting projects all around the world, (WARKA WATER 2017) (Olivier 2002) (Schemenauer R. S. 2005). A fog collector is simply a frame that supports a section of mesh in a vertical plane. As for the mesh, it is normally exposed to the atmosphere where the foggy air could be pushed through the mesh by the wind, with the droplets being disposed to the mesh, they combine to form larger droplets that run down passing into the storage tank in the bottom.

Raschel mesh is the material that is mostly used in fog harvesting applications worldwide. The mesh is made of a food-safe polyethylene and has a fibre width that makes it efficient in collecting water. On another hand, in some areas, it is not possible to use the Raschel mesh in the fog harvesting structure due to the lack of the material. In this paper, we explore the possibility of using different types of meshes and their environmental impact, as the construction industry had not only supplied some materials with positive environmental impact but ones that could be accompanied with pollution due to their production process.

METHODOLOGY

The process of using the meshes for the environmental structure must take into consideration their functionality and also must be accompanied by an evaluation of the impact of those meshes on the environment and their production effect on the atmosphere. The study includes an onsite and laboratory analysis of 10 suggested meshes and an analysis of the environmental impacts of the meshes depending on their physical properties and the material used in their production.

MESHES TESTS

Laboratory and on-site tests were performed. The laboratory tests were performed in a controlled environment in the Textile department laboratory and the Polymer department in the University of Minho on some suggested meshes. The

tests took in regards to test the meshes composition and permeabilities for Water Vapour and Air and also provided information about their physical characteristic that could affect their durability and maintenance such as the weight, and thickness. The results of the tests are as the following Table 1.

Table 1 Laboratory tests results on the suggested meshes

Meshes	Composition	WVP ratio	Air Permeability l/m ² /s	Weight g/m ²	Thickness mm	Open areas ratio
PA ^(a)	Polyamide	92.23%	N/A	477	1.68	59.91%
PE1* ^(b)	Polyethylene	97.5%	8805	305	1.56	43.89%
PVCPE1 ^(c)	72% PVC – 28% Polyester	93.92%	6784	235	0.78	40.55%
PVCPE2 ^(d)	71% PVC – 29% Polyester	91.26%	3194	317	0.77	22.92%
PVCPE3 ^(e)	65% PVC – 35% Polyester	85.57%	3475	309	0.90	20.96%
PVCPE4 ^(f)	50% PVC – 50% Polyester	84.95%	1175	314	0.64	7.54%
PE2* ^(g)	Polyethylene	83.39%	2889	64	1.31	23.47%
PVCPE5 ^(h)	67% PVC – 33% Polyester	82.93%	1707	353	0.67	11.85%
PVCPE6 ⁽ⁱ⁾	57% PVC – 43% Polyester	79.72%	1210	331	1.00	7.63%
PVCPE7 ^(j)	58% PVC – 42% Polyester	75.96%	1813	477	1.00	14.09%

*Meshes tested on site and in the laboratory

(a) Nylon shading mesh; (b) Plastic Green mesh; (c) Print MS25 (Endutex); (d) Print MS40 (Endutex); (e) Print RC3 (Endutex); (f) SunWorker (Dickson solar protection); (g) Black Shading mesh; (h)Print MS55 (Endutex); (i) Print MS74 (Endutex); (j) Print MP90 (Endutex).

The meshes with higher Air permeability were found to have higher open areas ratio, while most of the meshes with high WVP ratio were also found to have higher open areas ratio. The meshes selected for the on-site tests were those that present high air and water vapour permeability and at the same time have high open areas ratio, see Fig 1.

Figure 1 Ratio between the meshes Open areas and their Water Vapour and Air Permeability

The on-site tests were done by mounting some of the meshes on an experimental outdoor structure, in the laboratory of Paisagem, Guimaraes. The structure is, mainly, a frame of two horizontal aluminium pillars and of ropes that hold a mesh in between, a collecting tube and a storage is installed under the mesh, see Fig 2.

Figure 3: Fog harvesting structure, Laboratory to Paisagem, Guimaraes.

ENVIRONMENTAL CONDITIONING BENEFITS OF FOG HARVESTING MESHES

The meshes used in fog harvesting can have varied environmental effects depending on their material and their physical appearance. The composition, thickness and weight of the meshes have important effects on their durability, maintenance and their environmental properties, which are explored in this section.

Thermal Comfort

Most of the meshes used in fog harvesting have a certain amount of open areas that could affect the mesh ability to allow wind to pass through the mesh thus enhancing or worsening the mesh ability to collect water. The open areas in the meshes don't only affect its ability to collect water and filter the wind but also affect their ability of providing shading and protection from heat. It was found that with more solar radiation passing through the mesh higher is the temperature. To assure a good protective effect the mesh shading factor must be at least 50% (Buyle and Virgo 2015). The Raschel mesh

is preferred to have a 35% shading coefficient to perform efficiently as a fog harvesting mesh. Other meshes are produced with different open areas percentage and shading factors, that in some cases enhance their ability to provide shading and that might affect their water harvesting abilities, where, it is critical for the mesh to allow wind to pass through it to be able to capture water droplets deposited in the air, while larger percentage of open areas could increase its ability to capture fog, however it may decrease its ability to provide shading, as can be seen on Table2.

Table 2: Meshes with different Open Areas

Name	Open Areas	Thickness mm	Composition
PVCPE1 (A)	41%	0.78	72% PVC – 28% Polyester
PVCPE6 (B)	7.54%	0.64	57% PVC – 43% Polyester
PE2 (C)	23.5%	1.31	Polyethylene

Air Pollution Abatement

Fog harvesting mesh with their ability to collect fog could help in some cases, as the collection of fog, could limit the number of toxins in the air, where the meshes with higher ability of collecting water could provide improved air quality either by collecting toxins pollutants in the humid air or by rainfall which eventually also wash of the pollutants on the mesh surface down to the collector. However, this could have an opposite effect on the water collected, as it won't meet the WHO standards, making the collected water not safe for human and other living beings consumption. It was found that the urban areas fog could be affected by the presence of industries' emissions, as higher levels of particles and heavy metals are found in the fog of those areas (D.Ritchie, Richards and A.Arp 2006). The ability to absorb toxins disposed on the air proved to be higher in urban areas compared to rural areas, as the fog in urban areas exhibit higher levels of total organic carbon, nitrate and sodium and as a result have a lower PH level (Raja, et al. 2008).

Noise Pollution Abatement

Scientific literature is lacking studies on the physical and acoustical characteristics of polyester fibre materials, some barriers could add polyester to its composition as the ability of the polyester to absorb noise pollution could be affected by its thickness, surface area and fibre size , thus the higher the open areas of the mesh the lower its ability to perform as a noise barrier, for example in the study of (Lin, et al. 2015) it is noted on the first stages of the study that the mesh with higher open areas ratio have a lower sound absorption coefficient. On the other hand, PVC films could be added to the fabric as it could increase the fabric sound absorption at low and mid frequencies at the expense of higher frequencies (Seddeq 2009). It must be taken into consideration that fog harvesting meshes if implemented alone, are not able to provide effective noise abatement due to the lack of thickness and the openings in the meshes' fabric which affect their noise absorption. Thus, the only protection from nets alone to the noise is psychological as they offer visual protection to the source of noise, that could not be easily seen, thus reducing noise sensitivity.

ENVIRONMENTAL IMPACT

The environmental impact of the meshes could be linked to their harmful effect on the environment, taking in consideration the pollution emitted during production and after wasting. In the study case, most of the meshes under analysis are composed of polyester with PVC coating. Production of PVC emit chlorine gas, ethylene, dioxin, vinyl chloride, dichlorotane, mercury and other damaging substances. Thus leading to serious health problems, especially for the workers directly exposed to the production process if not enough cautions are taken. PVC is considered to be the largest source of chlorine in waste products. When burnt it can form concentrated hydrochloric acid and dioxin, among other gases such as Carbon Monoxide CO, Carbon Dioxide CO₂, methane CH₄, Barium Ba and Cadmium Cd (Berge 2000). On the other hand, Polyester can produce Styrene and dichloromethane during its production, while if burned it emits CO, CO₂, benzene, styrene, formaldehyde, which could be considered harmful in high concentrations.

Other meshes similar to the Raschel mesh are made from Polyethylene. Polyethylene is not easy to decompose, however, it could be burned without emitting dangerous gases (Berge 2000). Furthermore, some meshes are also composed of Nylon, one of the most commonly used Polyamides (PA), the production of nylon emits carbon dioxide, nitrous oxide, sulphur dioxide and methane among other gases. Nylon could be produced in many forms such as nylon 6 and nylon 6.6, where nylon 6 is produced from caprolactam and nylon 6.6 is produced from hexamethyl lene diamine and adipic acid. Nylon 6.6 is hard to recycle, and burned it emits harmful gases such as dioxins, nitrous oxide and hydrogen cyanide (Boustead 2005), (Boustead, 2005) and (Muthu 2014).

Embodied Energy and Green House Gas Emissions

Plastic products are mostly made from feedstocks derived from crude oil and natural gas processing. While half of the fossil fuel goes into the composition of the plastic itself the other half is combusted to provide the energy during manufacture. The amount of embodied energy and green gas emission, however, differs depending on the type of plastic products as demonstrated in Table 3 (Berge 2000).

On another hand, one of the most gases that increases the greenhouse effect is carbon dioxide, which is released from industrial manufacturing of the fossil fuel, and could pose a harmful effect on the environment if it passed a certain level, according to the United Nations' climate panel IPCC, there is a need to reduce human-caused emissions of carbon dioxide (CO₂) by about 45 percent from 2010 levels by 2030, reaching 'net zero' around 2050 (IPCC, 2018). Thus, the GWP (global warming potential) associated with the carbon dioxide emission, AP (acid Potential) associated with sulphur dioxide formed through burning fossil fuels and other industrial processes, are taken into consideration in the assessment of the material air pollution impact, (Berge 2000) and (Jones 2008).

Table 3 Embodied Energy and Pollution Potential

Material	Embodied Energy MJ/Kg	Embodied Carbon CO ₂ /Kg	GWP g/kg	AP g/kg
Polyester	103.83 ^(a)	2.7 ^(c)	2720 ^(e)	21 ^(f,g)
Polyvinyl chloride (PVC)	77.2 ^(a)	2.41 ^(a)	1400 ^(b)	13 ^(b)
Polyethylene	83.1 ^(a)	1.94 ^(a)	751 ^(b)	9 ^(b)
Polyamide	160.07 ^(a)	5.5-6.5 ^(a)	6700 ^(d)	12 ^(d)

Taking that in regards, the embodied energy and carbon of the suggested meshes was calculated depending on their weight and composition, see Table 4.

Table 4 Embodied Energy and Pollution Potential of the tested meshes

Meshes	Composition	Embodied Energy per m ²	Embodied Carbon per m ²	Weight Kg/m ²	GWP g/Kg	AP g/kg
PA	Polyamide	76.35	2.6 -3.1	0.477	3295.9	5.72
PE1*	Polyethylene	25.35	0.59	0.305	229	2.7
PVCPE1	72% PVC – 28% Polyester	19.89	0.59	0.235	415.72	3.6
PVCPE2	71% PVC – 29% Polyester	26.9	0.79	0.317	564.9	4.8
PVCPE3	65% PVC – 35% Polyester	26.7	0.77	0.309	575.36	4.9
PVCPE4	50% PVC – 50% Polyester	28.4	0.8	0.314	646.8	5.3
PE2*	Polyethylene	5.3	0.12	0.064	48.06	0.58
PVCPE5	67% PVC – 33% Polyester	30.35	0.88	0.353	647.9	5.5
PVCPE6	57% PVC – 43% Polyester	29.34	0.84	0.331	651.3	5.4
PVCPE7	58% PVC – 42% Polyester	42.16	1.21	0.477	932.2	7.8

ECONOMICAL ASPECTS

Fog harvesting structure needs to be applicable by being easy to construct and maintain, and it must be economical. As the structure, piping and maintenance costs remain constants, the changing factor was the type of the mesh used.

The different values of the meshes were obtained from the factories that produced the meshes and in some cases from the store where some meshes were bought, the cost of the meshes, illustrated in Fig 3.

Figure 3 Meshes under investigation and their costs from the factory

As mentioned earlier most of the meshes are composed of Polyester with PVC, however, the difference of the economic value of each mesh could be due to the percentage of each material, the thickness of the fabric and the rate of open areas in the material.

RESULTS AND DISCUSSION

In regards to the laboratory results, the meshes ability to provide higher water vapour permeability and air permeability is connected to its opening areas ratio, and the on-site results showed that two of three tested meshes are able to capture water from fog, the PA and PE1 meshes, thus, the physical characteristic of those meshes are considered as a reference to evaluate the ongoing laboratory tests' results. Where it was demonstrated that the ability of these two meshes to collect water is related to their open areas ratio and water vapour and air permeability. However, although the meshes collected water but they were unable to drain it down to the collector, so it was suggested that a coating material could help lowering the adhesion of the meshes to water, however, when applying a coating material such as Baygard clean, oil and water repellent fluorocarbon, with the standard heat of 170°C for fixing, it melted the nylon and polyethylene meshes, thus, promoting the need for a coating with no thermal fixing, such as in the case study of (Park, et al. 2013) where dip coating and spray coating on woven meshes were successfully used. Taking that into consideration, the functionality of the mesh is not the only aspect that affects the choosing process, but the environmental effects and the physical and economical properties of the mesh are also aspects to be considered when designing a functional harvesting system, see Table 5.

Table 5: Result of the meshes environmental analysis

Meshes	PVCPE 1,2,3,4,5,6,7		PA	PE1,2
Composition	Polyester	PVC	Polyamide	Polyethylene
Noise Abatement (Lin, et al. 2015), (Seddeq 2009)	Alone, psychological effect of reducing noise sensitivity.	Enhance the ability to reduce noise at low and medium frequencies	Alone, psychological effect of reducing noise sensitivity.	Alone, psychological effect of reducing noise sensitivity.
Air pollution Abatement (D.Ritchie, Richards and A.Arp 2006),	If functional as a fog harvesting mesh it has the ability to collect toxins attached to fog from the air			Some products have high ability to collect water from fog, thus, as a result collect toxins attached to the fog
Thermal comfort	Provides shading however that depends on the open area ratio or shading coefficient and type of the material			
Economical properties	Between 1.85 to 20 €/m ²		1.60 €/m ²	0.63 to 3.76 €/m ²
Embodied Energy MJ/kg (Jones 2008)	103.83	77.2	160.07	83.1
Embodied Carbon Co ₂ /kg (EIC 2010), (Jones 2008)	2.7	2.41	5.5 to 6.5	1.94
GWP g/kg (Berge 2000),(Boustead, 2005),(Adrien Bton 2012)	2720	1400	6700	751
AP g/kg (Berge 2000), (Nousiainen 1999), (Patel 2010)	21	13	12	9
Weight g/m ²	220 to 530 g/m ²		477 g/m ²	64 to 305 g/m ²
Thickness mm	0.60 to 1 mm		1.68 mm	1.31-1.56 mm

CONCLUSIONS AND FURTHER RESEARCH

While Polyethylene meshes are preferred due to their low levels of embodied carbon and embodied energy compared to most of the other meshes, however, PVCPE1,2 and 3 had similar embodied energy levels to the PE 1 mesh which is mainly composed of polyethylene, thus providing an alternative without the anticipated environmental damage linked to the production of the material, it must be noted, that the PVCPE1, 2 and 3 meshes, however, offer a high GWP and AP potential compared to the PE1 and PE2. On the other hand, although PA mesh was proved to be functional in collecting water it must be taken into consideration the high levels of embodied energy and embodied carbon associated with the mesh production and the high levels of GWP and AP compared to the rest of the meshes. PVCPE meshes have the advantage of providing more options for shading in comparison with the ability of the PE meshes, as some of them were designed for shading purposes. On another hand, Polyester, PVC and Nylon production processes and burning may emit some harmful gases to the environment if not treated properly while meshes composed of Polyethylene are not known to emit a high concentration of harmful gasses if burned.

In the process of deciding which mesh to apply on a structure, the functionality and the environmental profile of the mesh is important as the Polyethylene meshes have a lower harmful environmental impact and proved to be functional in some cases, i.e. PE1. However, it is possible to use other meshes that may have a higher economic and harmful environmental impact if not treated properly, but could capture water and provide some positive environmental benefits taking in consideration their physical characteristics.

Finally, when striving to achieve a functional system that provides environmental benefits, it is advised that further analysis is done both on the site and in the laboratory.

ACKNOWLEDGMENTS

This work has the financial support of 2C2T- Science Center of Textile Technology and the Project Lab2PT - Landscapes, Heritage and Territory laboratory - AUR/04509 with the financial support from FCT/MCTES through national funds

(PIDDAC) and co-financing from the European Regional Development Fund (FEDER) POCI-01-0145-FEDER-007528 and POCI-01-0145-FEDER-007136, in the aim of the new partnership agreement PT2020 through COMPETE 2020 – Competitiveness and Internationalization Operational Program (POCI and by national funds through the Foundation for Science and Technology of FCT-Portugal under the UID/CTM project / 000264. The project is developed with the support and assessment of Laboratory of Paisagem, Guimaraes, Portugal, and the support of the Global Platform for Syrian Student.
